

case study

arriVa condominium project

the customer

The arriVa condominium project is a luxury residential development in downtown Calgary, Alberta. ArriVa's soaring glass towers occupy a full city block and reach a height of 535 feet - the tallest residential towers in Alberta.

the challenge

The project's developer, Torode Residential Ltd., wanted to set a new standard for quality in construction, design, and lifestyle. The goal of the arriVa towers was to exhibit signature sophistication and include a collection of features eclipsing anything available on the market.

the solution

From Snaidero kitchens to Miele appliances, quartz countertops, and Poltrona Frau furnishings, the arriVa project exemplifies quality and luxury.

To extend the same level of sophistication and ambience into the elevators, the arriVa project incorporates elevator touchscreen systems from Touch-To-Go Technologies. Installation and maintenance services for Tower 1 were provided by Fujitec Canada. Tower 2 is currently under construction, scheduled for completion in 2010.

The elevator touchscreens exhibit a simple, contemporary aesthetic showing a crisp architectural rendering of the arriVa tower.

When a floor is selected, its location within the building is highlighted, showing the position and relative height of the floor within the building.

Instructional text on the screen reminds passengers that a security access card is required to access the residential floors, a helpful detail that could otherwise be overlooked and cause confusion.

The touchscreen gives the elevators a distinctively clean and modern appearance that ties in well with the rest of the property.
